Figure 18: A. Improvement of high-load coordination dynamics (CD) values in a patient with severe brain injury upon coordination dynamics therapy for several years. The high-load CD values were obtained by summing up the single CD values for forward and backward exercising, \( \Delta \) (high-load CD value) = \( \Delta 20N + \Delta 50N + \Delta 100N + \Delta 150N + \Delta 200N + \Delta 150N + \Delta 100N + \Delta 50N + \Delta 20N + \Delta 20N \). B, C. For comparing the rate of repair, the improvement curves of the high-load coordination dynamics values of an athlete (C) and a healthy pupil (B) are inserted. Note that the brain-injured patient needed much more time to achieve similar good CD values. D. Continuation of therapy. The substantial improvement of the high-load CD values (lower values), in the middle of 2018, motivated the patient Sotiris to continue his therapy at the limit.
