Background: Pancreatitis is a major public health problem with high associated economic costs. Accumulated research and empirical evidence suggests that excessive alcohol consumption is a major risk factor for both acute and chronic pancreatitis. In line with this evidence we assume that devastating combination of higher level of alcohol consumption per capita and ...
The World Health Organization (WHO) states that obesity is characterized as a positive energy balance that favors the accumulation of fat, associated with metabolic complications related to health risks such as high cholesterol and triglyceride levels, high blood pressure, and resistance to insulin [1]. ...
