In 2017 there were approximately 62000 new cases of thyroid cancer (TC) in the United States, with a death toll of less than 5%. This relatively low mortality rate is based on a grouping of all TC subtypes, which masks the small minority of patients with biologically aggressive tumors who have dismal prognoses for survival.

A Questionnaire Survey: Knowledge in Upper Airway Infections among General Practitioners in Malaysia

Background: Upper respiratory tract infections (URTI) cases are one of the most frequently seen cases in the primary care setting. The causative agents are either bacteria or virus. It is not easy to differentiate among them. In term of treatment for both conditions, certain principles of treatment are advised to be followed.

Effects of a plant based Biodegradable Middle Meatal Dressing after Endoscopic Sinus Surgery: A Prospective Comparative Study

Published On: November 14, 2017 | Pages: 121 - 125
Background: The benefit from biodegradable middle meatal dressings is well established, and includes improved wound healing, stabilization of the middle turbinate, reduced granulation tissue, and improved patient comfort. This study compares the outcomes of a 100% plant-based nasal dressing to a popular fully synthetic dressing in patients undergoing endoscopic si ...

The Effectiveness of Rehabilitation Programs of Learning Disabilities on Children with Attention Deficit Hyperactivity Disorder

Objective: The aim of this work is to evaluate the role of rehabilitation programs of learning disabilities on children with attention deficit hyperactivity disorder (ADHD) children, and compare the effect of pharmacological treatment, rehabilitation program of learning disabilities, and both together on children with attention deficit hyperactivity disorder (ADH ...

Extent of surgery in chronic rhinosinusitis: primarily focused on nasal polyposis

Background: The prevalence of chronic rhinosinusitis with nasal polyps (CRSwNP) is estimated at around 4% in general population. The population-based studies using rhinoendoscopy have demonstrated the prevalence of nasal polyposis, with values ranging from 0.5 to 2.7%.
