The Relationship between Plasma Levels of Large Neutral Amino Acids and Leptin in Women with or Without Obesity
Obese subjects usually have hyperaminoacidemia. Because leptin can affect the metabolism of amino acids, the relationship between them in obesity was investigated. The results showed obese women had significant elevation of plasma large neutral amino acids, which was positively correlated with the values of leptinemia and HOMA-IR.

Circulating MicroRNAs as Cancer Biomarkers: Can They Play a Role in Clinical Practice? Short Review

MicroRNAs (miRNAs) are a large family of short noncoding RNA sequences which modulate gene expression and regulate a wide range of biological processes. There is evidence that miRNAs may have a role in molecular mechanisms linked to tumorigenesis and a lot of studies have proven that some miRNAs are closely correlated with cancer.
