A comparative study of three different anaesthetic techniques in unilateral elective hip surgeries (combined lumbosacral plexus block, spinal and epidural) – A prospective randomized single blinded study

Abstract View | Full Article View | DOI: 10.17352/2455-3476.000046
Comparison of dexamethasone, granisetron and haloperidol in prevention of postoperative nausea and vomiting following laparoscopic surgeries: A prospective, double-blinded study

Published On: March 29, 2019 | Pages: 002 - 005

Author(s): Shikha Sharma*, Gnanasekar N and Pranjali Kurhekar

Background: Laparoscopic surgeries are most commonly performed surgeries. However, they are associated with increased incidences of postoperative nausea and vomiting. Aim: We aimed to compare the effectiveness of dexamethasone, haloperidol, granisetron in prevention of postoperative nausea and vomiting following laparoscopic surgeries. Methods: We conducted a rand ...

Risk assessment and anesthesia management in children with congenital heart disease undergoing non-cardiac surgery

Published On: May 08, 2019 | Pages: 019 - 021

Author(s): Kemal Tolga Saracoglu*, Ayten Saracoglu and Recep Demirhan

The prevalence of congenital heart disease is about 8 to 10 case per 1000 live births and is a major cause of increased mortality and morbidity in pediatric patients undergoing noncardiac surgery. Therefore safe anesthesia and adequate recovery should be provided. It is important to determine the patient's risk score in the preoperative period. However, the risk asses ...

General or non-general anesthesia: That is the question
The incidence of caesarean section (C/S) is increasing up to 40% even in many developed countries [1]. General and regional anesthesia techniques are used for providing anesthesia in C/S. Epidural anesthesia ensures better control of sensory level as compared to spinal anesthesia and provides better postoperative analgesia. However, it is easier and faster to perform ...
