N-(carboxymethyl) lysine (CML), an advanced glycation end product (AGE), is an aging factor produced by glycation of protein. Higher levels of AGE in skin tissue are related to skin elasticity, but how CML that has accumulated in the skin affects hair follicle formation is unclear. This study constructed a simple model that mimics accumulated glycation from feeding b ...
Isolated bilateral facial palsy due to chicken pox - An unique presentation

Published On: January 12, 2019 | Pages: 001 - 002

Author(s): Nandini Chatterjee and Chandan Chatterjee*
