Prolotherapy with 12.5% dextrose to treat temporomandibular joint dysfunction (TMD)

Published On: April 17, 2019 | Pages: 015 - 019

Author(s): Ehab Shehata*

Introduction: Temporomandibular joint dysfunction (TMD) is a collective term used to describe a complex and multifactorial disorders of the orofacial region. Symptoms commonly associated with TMD include TMJ pain, limited mandibular movement or locking and painful clicking or popping sounds. Most of patients diagnosed with TMD are initially treated conservatively. Fai ...
Can human amniotic membrane be used as an Ideal Suture or Filling Material?  
An Experimental study

Published On: February 26, 2019 | Pages: 005 - 009

Author(s): Fatma Bilgen*, Alper Ural, M Nuri Karatoprak and Mehmet Bekereciolu

Background: The use of the patient's own tissues in surgery increases the morbidity rate, whereas the use of injected or implanted materials can cause allergic reactions in the body mostly via immunogenic pathways. In addition, absorbable suture materials and some fillers used in almost all surgical applications can cause reactions in the body. Objective: The use of ...

The effect of Gauze Dressing use on reduction of Oronasal Fistula Rates following Cleft Palate Repair

Published On: February 22, 2019 | Pages: 001 - 004

Author(s): Fatma Bilgen*, Alper Ural and Mehmet Bekereciolu

Background: The most incident and the most persistent complication following cleft palate repair is oronasal fistula. Fistulas involving the soft palate may be corrected via excision and primary closure; however fistulas of the hard palate constitute a major challenge. Aims: In this study, in order to reduce the rate of oronasal fistula following cleft palate surgery ...

Palatal pedicle graft for management of a severe case of black triangle: A case report

Published On: May 15, 2019 | Pages: 020 - 023

Author(s): Saket Kashyap*, Siddharth Rai, Sandeep JN and Sushama R Galgali

Development of black triangles following surgical periodontal therapy in severe cases of periodontitis is a common
complication faced by patients and clinicians. Restoring the natural form of the interdental area is of utmost importance especially when the anterior aesthetic zone is involved. A wide variety of approaches have been advocated to manage such aesthetic en ...
