Introduction: This study was conducted for evaluating and comparing levels of patient discomfort during phacoemulsification and intraocular lens implantation under topical and peribulbar anesthesia and comparative assessment of intra-operative complications. ...
Introduction: Benign intracranial hypertension (BIH) is a disorder defined by symptoms and signs suggestive of increased intracranial pressure (ICP) in the absence of any cause evident on neuro-imaging or other evaluations. Usually the disease has a variable outcome but chances of severe visual loss are only 6%. ...
