Objective: During the postmenopausal period, visceral fat tissue is responsible not only for increased cardiometabolic risk, but also for endocrine function leading to increased endometrial thickness (ET). The current study aimed to 1) determine the predictive value of ultrasonographic visceral fat thickness (VFT) and the visceral adiposity index (VAI), which is defi ...
The midwife provides health care for pregnant women and women in labor and take care for newborn children and infants. It can also work in gynecological departments by providing basic nursing care to women with reproductive system diseases.
