Anxiety and depression levels in patients with chronic orofacial pain

Published On: May 28, 2020 | Pages: 018 - 023
Introduction: Orofacial pain can be highly distressing, affecting 10% of the population and is associated with psychological symptoms. This study aims to assess the frequency of such psychological symptoms in orofacial pain patients compared to a control group and how these symptoms change with treatment. The effect of social deprivation will also be explored.
